Subject: methane

Someone needs to monitor the methane and other gas levels coming off the work over rig on the Anvers site and the flowback job in process on the Statoil site across the road from them. The methane is extremely high this morning, I have had a kitten in the house just die from the gas. Past testing on other animals we have had die have showed extreme high levels of methane-high enough to kill a small animal. This needs to be done within hours-asap- there must be at least one of the companies that has a gas monitor available to do this and get these levels under control.
